CV-SALTS
 CV-SALTS – Developing new approaches to protect Central Valley soils and water

The Central Valley faces a future where rising salt levels threaten to turn this productive basin into a land where the water is not fit to drink and land not capable of growing crops. It won't happen tomorrow, or even next year, but salts are slowly and steadily contaminating water and soil, which are so important to agriculture and water supplies for more than 25 million people across the state.

The salinity problem is complex and multi-faceted, so a broad coalition of agriculture, cities, industry, and regulatory agencies have joined together to develop a vision and plan for managing salts and nutrients. The Central Valley Salinity Alternatives for Long-Term Sustainability initiative (CV-SALTS) is a collaborative effort initiated in 2006 to find solutions to

Phase 3 Conceptual Model

© Published on Friday, 02 November 2012 10:41

Project Description: Development of the Conceptual Model to support preparation of the Salt/Nitrate Management Plan (SNMP) was initiated under CV-SALTS' Initial Conceptual Model (ICM) Project (completed in April 2013) and refined under CV-SALTS' Phase 2 Conceptual Model project. This project builds off the work completed to date and focuses on development of the program of implementation for incorporation into the SNMP and completion of regulatory analyses and documentation to support adoption of the SNMP in the Basin Plan.

Project Status: Project is planned for initiation by October 2013 with completion expected in May 2014.

Phase 2 Conceptual Model
 Project Description: Development of the Conceptual Model to support preparation of the Salt/Nitrate Management Plan (SNMP) was initiated under CV-SALTS' Initial Conceptual Model (ICM) Project (completed in April 2013). This project builds off the findings of the ICM. Under Phase 2 the project team will refine the findings from the ICM and delineate management zones. Establishment of these management zones provides the framework for implementation through implementation of the SNMP. Following completion of Phase 2, the project team will develop a program of implementation and completion of regulatory
